1

YOUR MUSIC, RANKED

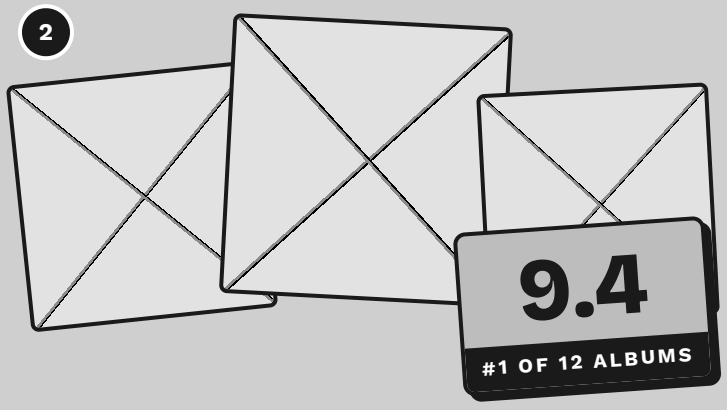

Which one's better?

Choonit ranks your records by making you pick. Answer a few head-to-heads and every album and track lands exactly where it belongs.

Sign up free

Sign up with your email or with Google. 6

2

3

Three moves. That's it.

1 **Search a record**
Any album or track, or the artist behind it.

2 **Pick the better one, a few times**
We show you two records at a time and you tap the one you like more. Nothing to type, no sliders needed.

3 **Get your rank**
It slots into your list and gets a score out of 10.

4

Two lists. No apples to oranges.

Albums and tracks are ranked separately, so a great track never has to fight a great album.

Albums | Tracks

5

Start with the record you've had on repeat.

NOTES

1. The hero asks the product's question. Only two actions on a public page: Sign up and Log in.
2. Cover art leads. A fan of three covers plus a sample rank sticker shows what a ranked record looks like.
3. Revised copy: still three cards. Step 2 now reads "Pick the better one, a few times". The landing page never names the sentiment choices; they appear only on W-Sentiment. The cards mirror the "log a new record" flow: search, compare, get your rank.
4. Two separate ranked lists, Albums and Tracks, called out early so the rule isn't a surprise. (Revised copy; EPs count as albums, singles as tracks.)
5. Repeat the sign-up call to action. After email sign-up the user goes to "Check your email" (W-CheckEmail), then lands on an empty Profile.
6. New: one short line under the hero call to action says Google is an option. It is text, not a button, so the public page keeps only Sign up and Log in. The Google flow runs Landing, Sign up, Continue with Google (on W-Auth), Choose username, Profile.

Grayscale = structure only. Color = Crate Digger tokens: royal blue blocks, paper, navy keylines, hot pink for the verdict and the primary action.

NOTES · REVISED

1. One short form per screen, lifted onto the blue block. Sign up adds a username so the profile has a name from the start. Email sign-ups pick it here; Google sign-ins pick it on W-ChooseUsername.
2. Email and password only. Minimum 8 characters, with a Show toggle instead of a confirm field.
3. The dashed box marks where a generic sign-in error goes ("That email or password isn't right."). Errors appear inline above the button and are announced to screen readers. After success: Sign up goes to W-CheckEmail; Log in goes to Profile.
4. "Forgot password?" link under the password field, Log in only. It is a real link (44px tall, underlined so it isn't color alone) and goes to W-Forgot. Flow: Log in, Forgot, Check your email, (email link), Reset, Log in. Revised note: for a Google-only account the reset request shows the same generic confirmation as any other address, with no hint of how the account signs in.
5. New: "Continue with Google" above the form on both Sign up and Log in, then an "or" divider. A plain white button with a neutral placeholder "G" mark. The real button must follow Google's branding guidelines (official G logo and spacing, and the wording Google allows); this one is only a layout placeholder. A new Google user goes to W-ChooseUsername; a returning one goes to Profile. Google profile pictures are ignored.
6. New: Sign up checks the username as the user types and says so under the field, icon plus text: checking (announced politely), available (announced politely), taken and invalid (role="alert", aria-invalid, heavier border, not color alone). Uniqueness is enforced again on submit, so two people claiming one name at the same moment still get the taken message. No feedback is shown while the field is empty.
7. New state, Log in: "Confirm your email first." Shown when an email sign-up tries to log in before clicking the confirmation link. Inline error (role="alert", icon, bold text) with a "Resend confirmation email" button (48px) inside it. Not reachable by a link on this board; it is shown by the server's reply to a Log in attempt. The 360px phone is this state at its tightest.
8. New state, Log in: Google sign-in cancelled or denied. The user is back on Log in with an inline message above the form (role="alert", icon, text) and can try Google again or use email. Shown after returning from Google; not reachable by a link on this board.

Phones, top row of each theme: Sign up default, checking, available, taken, invalid. Second row: Log in default, confirm email first, Google cancelled, confirm email first at 360px, Sign up taken at 360px. W-Auth is one board for both forms, so a link into it cannot choose a state. Forgot and Reset close the earlier password-reset gap.

NOTES · NEW

1. Where Sign up on W-Auth goes after the form is submitted. It echoes the address the user typed and says what to do: open the link in the email. One h1 on every state. Google sign-ups never see this screen, because Google has already verified the email.
2. "Resend email" is the one primary action on the sent state; "Send a new link" is the one on the expired state. Both are 48px tall and have visible text labels.
3. Resend cooldown: right after a resend the button is disabled and reads "Resend in 30s" (dashed, muted, aria-disabled; the label counts down). The "Sent again" line is announced politely, with a check icon and text. The 30 seconds is a proposal.
4. "Use a different email" (back to the Sign up form) and "Back to log in" are links on every state, both 44px tall and underlined. W-Auth is one board for both Sign up and Log in, so both land on that board.
5. Link expired or already used: not reachable by a link on this board. It is shown when the user opens an old or used confirmation link from their inbox. The message is announced (role="alert") with an icon and bold text, and offers "Send a new link".
6. After the user clicks the emailed link they are confirmed and land on Profile (the brand-new-user empty state, see W-Profile). The dashed link is a wireframe-only shortcut for walking that step; it is hidden in the color theme. Trying to log in before confirming is covered on W-Auth ("Confirm your email first").
7. Route: this screen is **/check-email**. It is not in the README's Pages table yet; add it there (public, no auth). Reached right after email/password sign-up.

States: sent, resend cooldown, link expired or used. The 360px phone is the cooldown state, where the heading and the disabled button are tightest. Flow: Sign up, Check your email, (email link), Profile.

CHOOSE USERNAME · /CHOOSE-USERNAME · SIGNED IN · SHOWN TO GOOGLE SIGN-INS UNTIL A REAL USERNAME IS CHOSEN · NEW

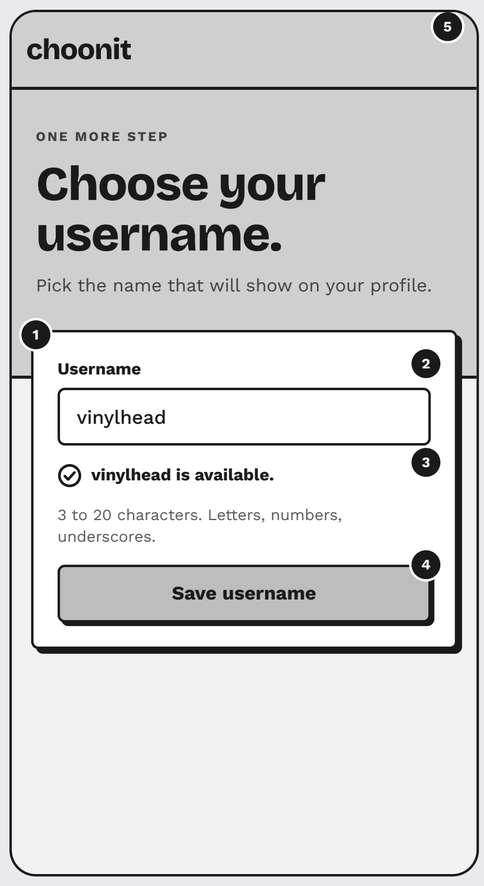

WIREFRAME · DEFAULT, GENERATED NAME

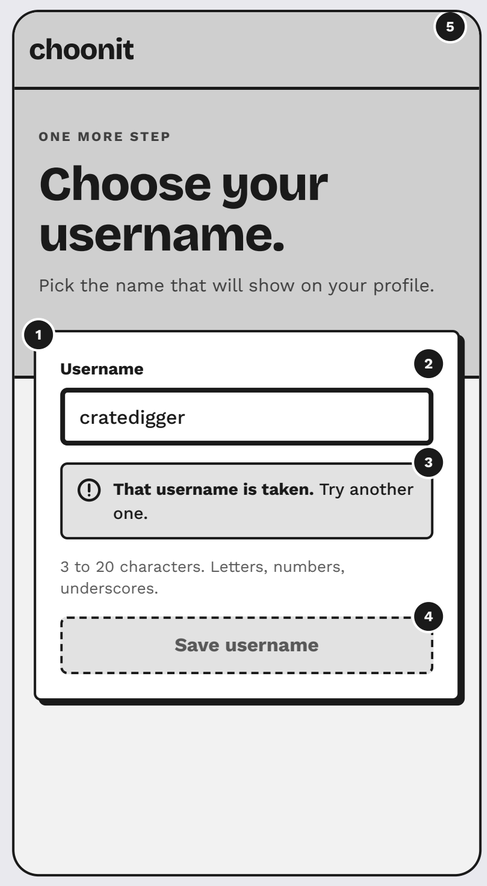

WIREFRAME · CHECKING AVAILABILITY

WIREFRAME · AVAILABLE

WIREFRAME · TAKEN

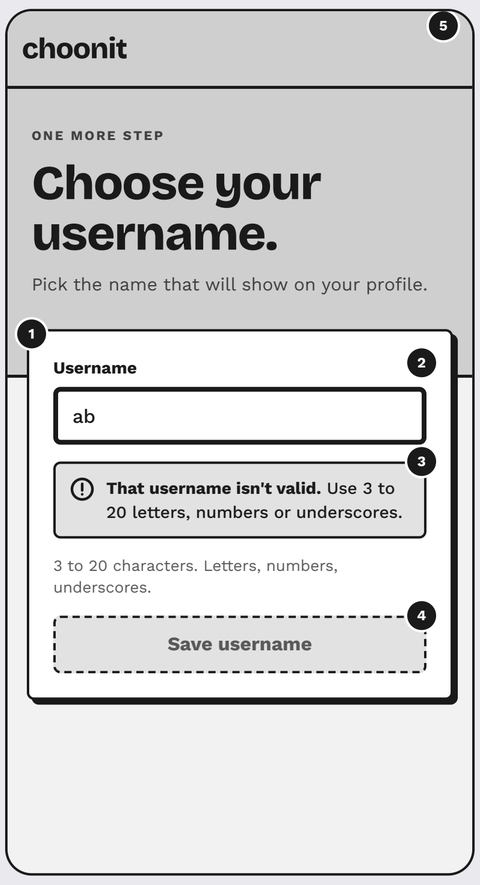

NOTES · NEW

1. One field, one button. One h1: "Choose your username." with the line "Pick the name that will show on your profile." Shown only to Google sign-ins (new users). Email sign-ups pick their username on the Sign up form.
2. The field has a visible "Username" label and arrives pre-filled with a generated name (user_a1b2c3d4) that is already selected, so typing replaces it. Rules: 3 to 20 characters, letters, numbers, underscores, unique.
3. Status line under the field, every state icon plus text: checking (announced politely), available (announced politely), taken and invalid (role="alert", aria-invalid, heavier border, bold lead-in text, never color alone), saving. Availability is checked as the user types, after a short pause. Uniqueness is enforced again on save, so two people claiming one name at the same moment still get the taken state.
4. "Save username" is the single primary action. Proposal for your decision: it stays disabled (dashed, labelled, with aria-disabled) while the field still holds the generated name, while checking and while invalid or taken, because the README says Google accounts must choose a real one. After saving the user lands on Profile (empty state). While saving the label reads "Saving...".
5. No close, no skip, no back link, and the logo is plain text. The app keeps redirecting any signed-in page here until a username is chosen. Reached from W-Auth or W-Landing via Continue with Google, so there is no link into it on those boards other than that button. Returning Google users skip this screen.

States, left to right: default (generated name), checking, available, taken, invalid, saving. The 360px phones are the taken and invalid states, where the error text is longest.

NOTES · NEW

1. One field, one button. The label "Email" is visible. Reached from the "Forgot password?" link on the Log in state of W-Auth. Submitting shows the confirmation state (or the error state); those are state changes, not links.
2. Invalid email (empty or not shaped like an address) shows an inline error. It is announced (role="alert"), tied to the field (aria-describedby, aria-invalid), and not color alone: icon, bold "Check the email." text and a heavier field border. A well-formed address is never an error here, whether or not an account exists.
3. Confirmation: "Check your email". The wording is identical for every well-formed address, so it never reveals whether an account exists. It echoes only what the user typed.
4. "Back to log in" is on every state: a link under the form, and the primary button on the confirmation. Both go to W-Auth (it holds both Sign up and Log in states).
5. In production the next step happens in the user's inbox: the emailed link opens /reset-password (W-Reset). The dashed link is a wireframe-only shortcut so the flow can be walked; it is hidden in the color theme.

360px phone: the error state, where the heading and button are tightest. Flow: Log in, Forgot, Confirmation, (email), Reset, Log in.

RESET PASSWORD · /RESET-PASSWORD · PUBLIC, OPENED FROM THE EMAILED LINK · NEW

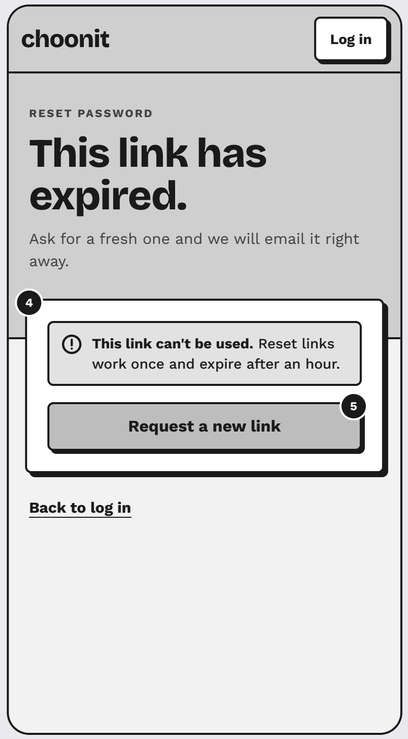

WIREFRAME · NEW PASSWORD

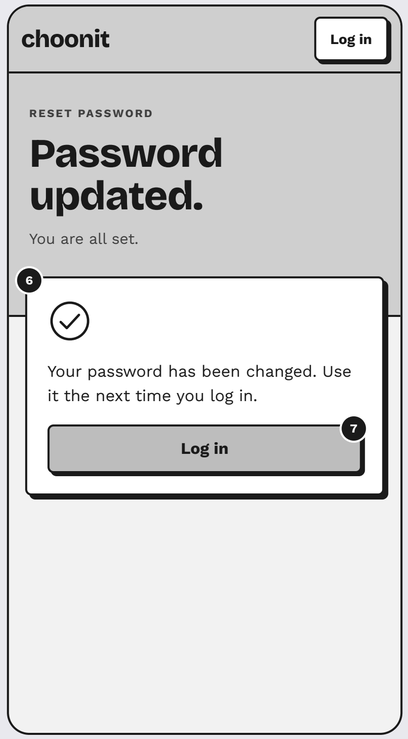

WIREFRAME · TOO SHORT

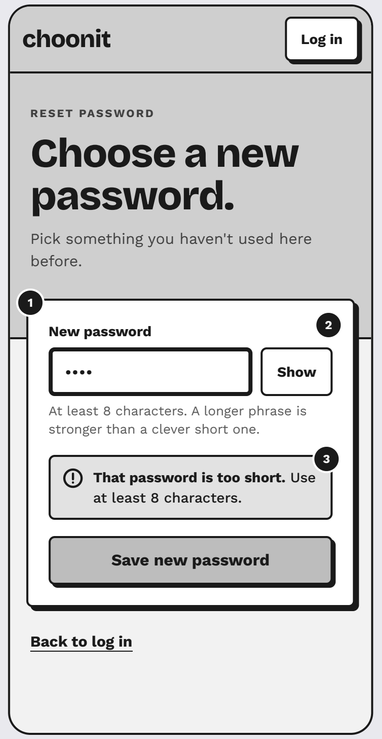

WIREFRAME · LINK EXPIRED OR USED

WIREFRAME · SUCCESS

WIREFRAME · TOO SHORT · 360

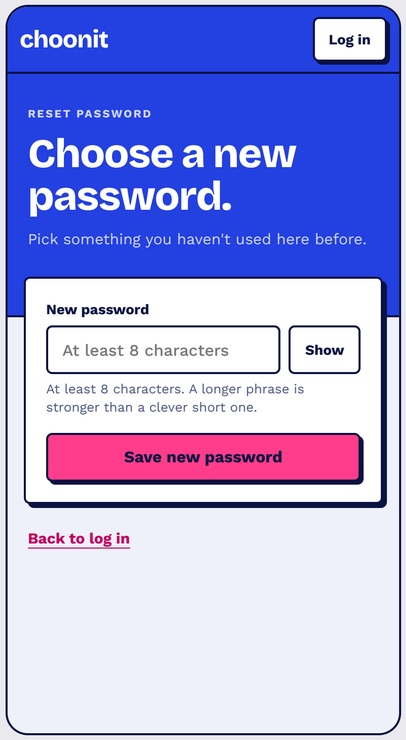

NOTES · NEW

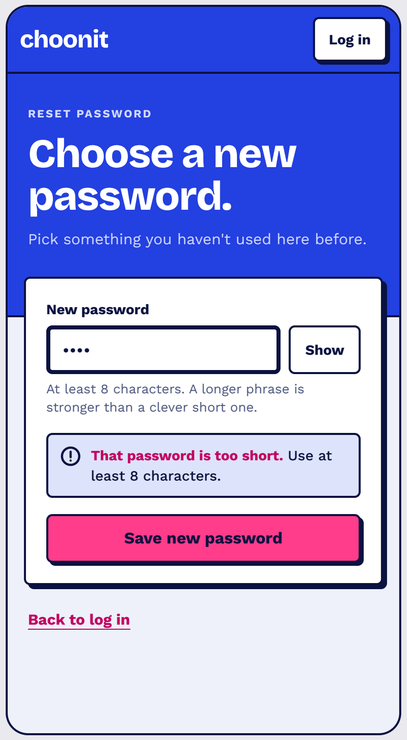

1. Reached only from the link in the reset email. One field and one button. The header shows "Log in", not the signed-in bar. Saving success or failure is a state change, not a link.
2. Visible label "New password", a "Show" toggle (aria-label "Show password", 48px tall) and a hint that says the rule up front. No confirm field, same as sign up.
3. Too short or otherwise invalid: inline error, announced (role="alert"), tied to the field, and not color alone (icon, bold lead-in text, heavier field border). The user stays on the form with the field kept.
4. Expired or already used link. Not reachable by a click: it is shown when the page opens with a token the server rejects (used, expired, or malformed). The message does not say which, and it is announced.
5. "Request a new link" is the single primary action and goes to W-Forgot. "Back to log in" stays as a link.
6. Success: replaces the form after saving. Announced politely (role="status"). Shown only after a successful save, so no link reaches it.
7. "Log in" is the single primary action and goes to W-Auth.

Phones, left to right: new password; too short; expired or used link; success; and the too-short state at 360px, where the field plus Show button is tightest.

SEARCH RESULTS · /SEARCH?Q= · SIGNED IN · REVISED

WIREFRAME · RESULTS

WIREFRAME · NO RESULTS

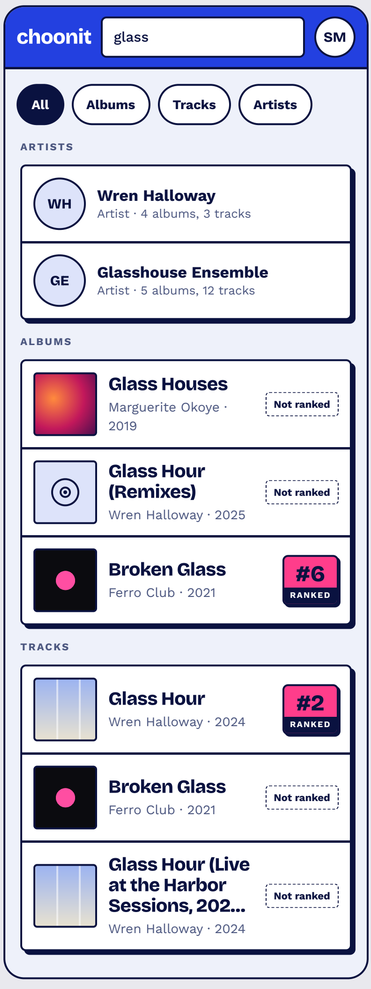

NOTES

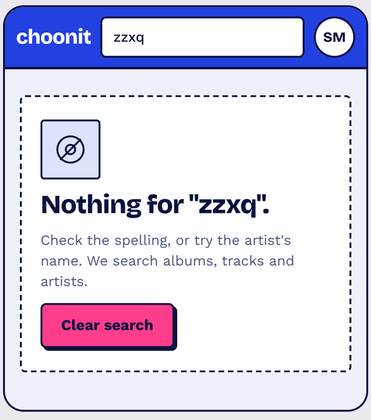

1. Search lives in the top bar on every signed-in page. Submitting lands here with the query in the box.
2. Filter chips: All, Albums, Tracks, Artists. No format labels. Proposal; scrolls sideways if it ever overflows.
3. Artists first and short, with album and track counts. Each row goes to the artist page.
4. Albums (albums and EPs, one row per release group). Right edge shows your status: rank sticker, or "Not ranked". Rows go to the Album page.
5. No cover in the Cover Art Archive: a tinted tile with a record glyph, same size and outline as a real cover.
6. Tracks (recordings, including singles). Rows go to the Track page, with the same status on the right.
7. Long titles wrap and stop at three lines with an ellipsis; the full title is on the Track page.
8. No results: say what was searched, suggest a fix, offer Clear search.

Revision: results regrouped as Artists / Albums / Tracks; chips renamed; Single / EP / LP labels removed. Tracks section is new.

WIREFRAME · NOT RANKED

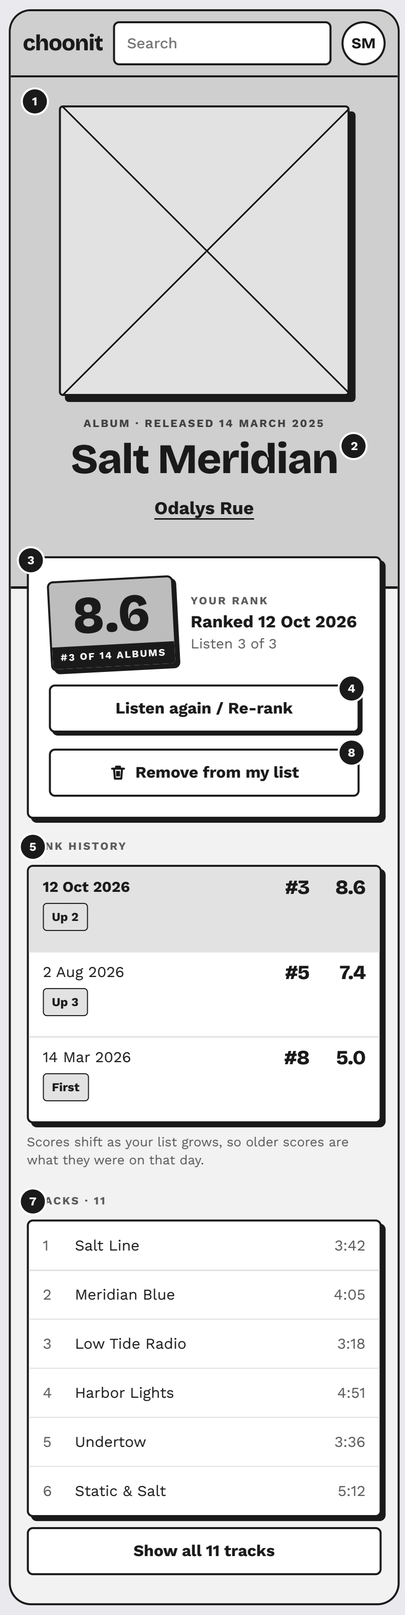

WIREFRAME · RANKED, WITH FACTORS

WIREFRAME · RANKED, FACTORS SKIPPED

WIREFRAME · RANKED, FACTOR BARS SETTING OFF (NEW)

WIREFRAME · REMOVE CONFIRMATION (NEW)

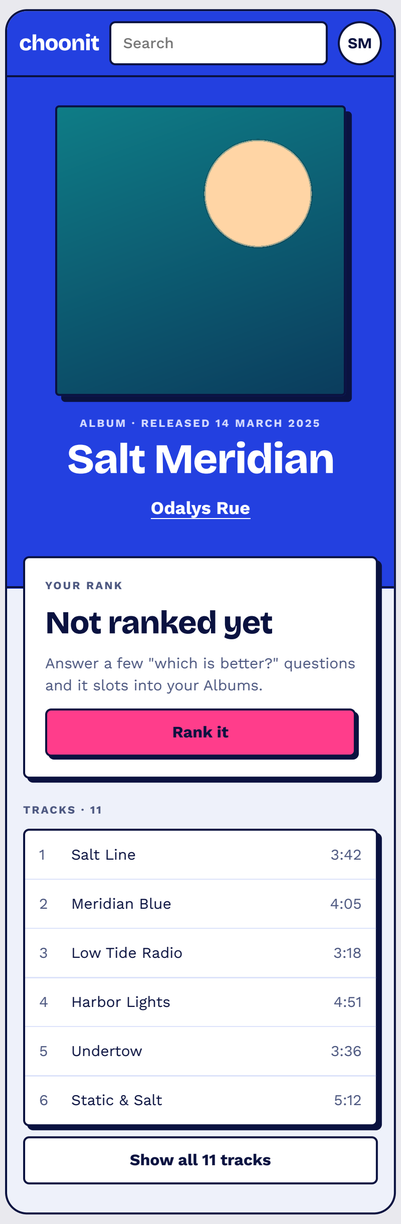

NOTES · REVISED

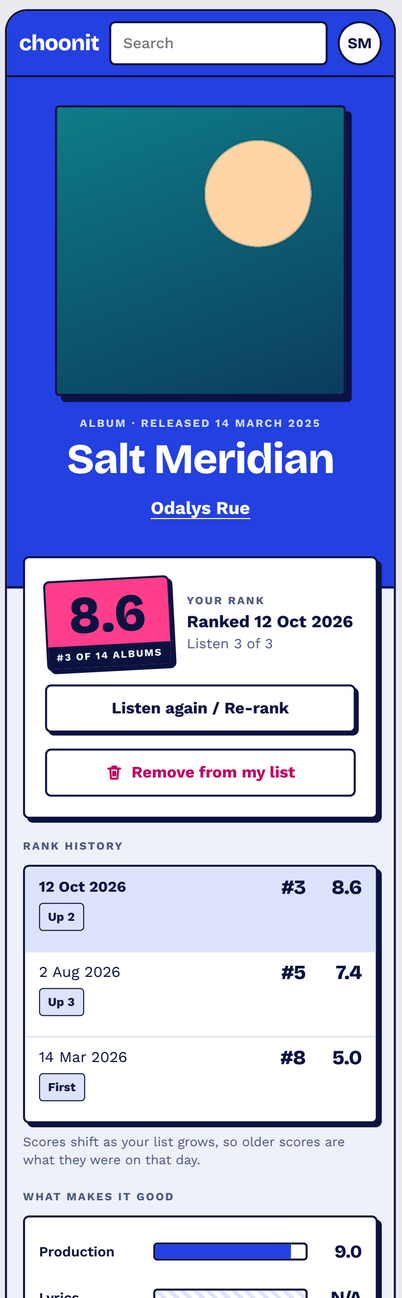

1. Cover art is the hero: nearly full width, on a blue block with a hard shadow.
2. Title, then the artist as a link to the artist page. The eyebrow just says "Album" (EPs are albums too).
3. Rank panel overlaps the hero. Unranked: "Not ranked yet". Ranked: sticker with "#3 of 14 Albums" on its strip, so the number never stands alone. Positions are allowed on item pages; Compare and Sentiment never show them.
4. One action: "Rank it" the first time, "Listen again / Re-rank" afterwards. Revised: both now go to W-Sentiment, the first screen of the Compare route, and a re-rank asks again.
5. Rank history: every rank event with date, rank and score. Each row carries an Up / Down / First tag. Sentiment is never shown back to the user: no tag, label or section for it on this page. Latest is highlighted and is the current rank. Tags are text, not color only. Each event also stores its factor values (not shown here).
6. Factor bars, ranked state only: seven bars in a fixed order (Production, Lyrics, Originality, Melody, Replay value, Emotion, Cultural impact), each with a number. Lyrics can show "N/A" (hatched bar, read out as "not applicable"). Any other skipped factor shows an empty dashed bar and "—" (read out as "skipped"). Revised: when the profile setting "Show factor bars on my pages" is OFF the whole section is not rendered: no heading, no placeholder, nothing. That looks identical to the factors-skipped state on purpose; the difference is that the saved values still exist and come back when the setting is turned on. The setting lives on Edit profile.
7. Track list from MusicBrainz, trimmed to six with Show all. Display only. Albums only: the Track page has no list.
8. New: "Remove from my list", ranked state only. A secondary button in a destructive style (outline, trash icon and text, never color alone), 48px tall. It opens the confirmation (pin 9) and does nothing else. After removing, the gap in positions closes.
9. New state: confirmation dialog, drawn as a viewport crop (the page is scrolled to the rank panel, with the page dimmed behind). It says what will be deleted: the ranking and all of its history. "Remove" is the destructive button and goes to Profile. "Cancel" closes it. Focus: on open, focus moves into the dialog on "Cancel" (the safe choice); Tab and Shift+Tab stay inside it; Esc and Cancel close it and return focus to the "Remove from my list" button; after Remove, focus goes to the Profile heading. The shared record stays; only your ranking and history go.

Revision: Remove from my list and its dialog, factor bars OFF state. The five states left to right: not ranked, ranked with factors, ranked with factors skipped, factor bars setting OFF, remove confirmation.

To rank this version, remove the other one from your list first.

7 APPEARS ON

- Quiet Engines (Deluxe Edition) — Wren Halloway · 2024
- Glass Hour (Remixes) — Wren Halloway · 2025
- Late Night Rotation, Vol. 3 — Various artists · 2024

NOTES · REVISED

1. Same hero as the Album page. A track has no cover of its own: it borrows the art from one of its releases. If none of them has art, the left-hand states show the tinted tile with a large record glyph.
2. Title wraps to as many lines as it needs here (it's the one place the full title is shown). The artist is a link to the artist page.
3. Same rank panel as albums; the strip reads "#2 of 23 Tracks".
4. "Rank it" or "Listen again / Re-rank" goes to W-Sentiment (the first screen of the track Compare route). Re-rank asks again.
5. Same rank history as albums. Each row shows date, position, score and an Up / Down / First tag; sentiment is never shown back. Each event stores its factor values.
6. Same factor bars as the Album page: seven in the same order. Sample: Lyrics 9.0 (set), Cultural impact skipped, shown as "—" (read out as "skipped"). Lyrics may show "N/A" when that was chosen. Revised: with the profile setting "Show factor bars on my pages" OFF, the section is not rendered at all (third phone), the same look as when the factor step was skipped. The setting lives on Edit profile.
7. "Appears on": every release the recording is on (album, EP, single, compilation), each linking to its Album page. No track list on this page. A track is ranked once, no matter how many releases it appears on.
8. New: "Remove from my list", ranked state only. Outline button in a destructive style (trash icon and text), 48px tall. It opens the confirmation. After removing, the gap in positions closes.
9. New state: confirmation dialog, drawn as a viewport crop over the dimmed page. It says the ranking and all of its history will be deleted. "Remove" (destructive) goes to Profile; "Cancel" closes. Focus moves to "Cancel" on open, Tab and Shift+Tab stay inside, Esc or Cancel return focus to "Remove from my list", and after Remove focus goes to the Profile heading.
10. New state: duplicate song. When another recording of the same song (same MusicBrainz Work) is already ranked, the Rank it button is replaced by this card. It says "You already ranked a version of this song", names the other version with your rank, links "Go to your ranking" (44px tall, underlined) and says to remove the other version first. One ranking per song per user. Sample: this page is California Love (Remix); the ranked one is California Love (Original Version).

Revision. States left to right: not ranked (no cover), ranked with factors, factor bars OFF, remove confirmation, duplicate song. Everything uses existing components; nothing restyled.

COLOR · ALBUM, LISTEN AGAIN

COLOR · TRACK, LONG TITLE · 360

NOTES · NEW

1. Same full-screen focus as Compare: no top bar, just a 44px close button back to the item page (Album page or Track page). Nothing is saved yet. This is the first screen of the Compare routes, not a separate route.
2. The record being ranked is pinned at the top (sticky): cover, type tag, title (two lines, then clamped) and artist. It stays pinned on the next screen as the "Ranking now" card.
3. One h1: "How did it feel?". The line under it says why it matters, in plain words.
4. Three stacked choices, each 76px tall with a label and a short descriptor: Loved it (one of your favorites), It was fine (has its moments), Not for me (didn't click). Each has an icon, so the label is never the only cue. Nothing is preselected, in any state. They are links in this prototype; in the build each is a button that keeps the choice in memory and continues. Order is fixed.
5. Selected state: a heavy ring plus a "Selected" text marker with a check, never color alone. It shows for a moment after the tap, then the app continues. Drawn here on "Loved it".
6. Re-rank ("Listen again"): sentiment is asked again from scratch. The previous answer is not shown and nothing is preselected, so the user answers fresh.
7. This screen and Compare never show list positions, scores or ranges. No "#N", no numbers out of ten. The result is revealed only after the last answer. Sentiment is an input only: it is never shown back to the user anywhere else in the app, so this is the only board where the three words appear.

Edge cases, no extra screen. The chosen sentiment has no other records yet: Compare is skipped and the app goes straight to the Factor sliders (W-Factors); the record is placed at the start of that group of the list. The sentiment has exactly one other record: one question, labelled "Last question", no Skip (see W-Compare). The 360px phone is the long-title track, the tightest layout. The link on each choice goes to W-Compare in this prototype.

COLOR · TRACK, ONE RECORD IN GROUP (NEW)

NOTES · REVISED

1. Full-screen focus: no top bar, just a close button back to the item page. Revised: this screen now follows W-Sentiment (the first screen of the same routes). Nothing is saved until the last answer. Answering the last question goes to the Factor sliders (skippable), which then returns to the item page with the result. The cards on the final-question states link to W-Factors.

2. Revised: the line names the group being compared against in plain words (always "Comparing with records you felt the same way about", for albums and tracks, so the screen never names a sentiment). The old "Ranking your Albums" wording, which implied one list, is gone. Progress says "about N" because binary insertion needs roughly log2(n) answers, counted within that group only. The last question reads "Last question". Text plus segments, never segments alone.

3. The only question the app ever asks, set huge. Identical in both variants.

4. The record being ranked ("Ranking now") stays pinned in the left slot for the whole flow. After each answer only the opposing card is replaced, by the next record from the same group. Two big cover cards, each a single tap target. Same layout for albums and tracks; track cards show a single-track cover (borrowed from one of its releases, placeholder if none). Titles clamp to 3 lines with "overflow-wrap: anywhere" so a long title fits at 360px. The full title is on the item page.

5. Undo is not in v1. Skip stays: it swaps the opposing card for a different record from the same group, chosen so the question still narrows the same way. When there is no other record to offer (the last question), Skip is hidden and a short line says why.

6. The tapped card shows a selected state (heavy ring plus a "✓ Your pick" tag) for a moment, then the opposing card is swapped for the next record. The text tag means it never relies on the ring alone. Drawn on the opposing card; the pinned card selects the same way.

7. The last question. The cards are real links to W-Factors (anchors, since a button can't carry an href; in the build, answering saves the answer then navigates).

8. Compare never shows list positions, scores or ranges, and neither does W-Sentiment. No "#N", no numbers out of ten, no strip, no banner, no "Your #N" tag on the opposing card. The result is revealed only after the last answer. The "Listen again" header label marks a re-rank, and a re-rank asks again.

9. New state: a group with exactly one other record. The new record gets exactly one question, labelled "Last question", with one progress segment and no Skip. The wireframe cards link to W-Factors, same as any last question. Drawn for albums and for tracks, in a group of one.

Edge cases, no extra screen: if the chosen group has no other records yet, this page is skipped and the record goes to the start of that group (position #1 only when the whole list is empty), then to the Factor sliders. A track on several releases is ranked once. Sample data: the pinned records are Salt Meridian (Album) and Glass Hour or the long-title track (Tracks). Sentiment is never named on this screen.

NOTES · REVISED

1. Reached from the last Compare question (both variants link here). "Skip" is in the header and in the bottom bar, so it is never hard to find.
2. Copy says plainly that factors don't change the score. The item name fills in: an album (Salt Meridian) or a track (Glass Hour).
3. Revised: seven factors, in this order: Production, Lyrics, Originality, Melody, Replay value, Emotion, Cultural impact. Half steps (0 to 10, step 0.5). Native range inputs: arrow keys move the value; every row is at least 44px tall (56px for single-line rows). Untouched sliders look unset: value "—", hatched track, hollow dashed thumb in the middle. A slider becomes set on its first touch, click or key press, and only set sliders are stored. The middle position is not a value.
4. Revised: Save and Skip live in a bar pinned to the bottom of the screen, so they stay visible while the seven rows scroll. It is drawn at 390px and at 360px; the 360px phone is also shorter (640px tall), so its rows actually scroll under the bar. Save is always enabled; saving with nothing set is the same as Skip. Destinations: album variant returns to the Album page (W-Music), track variant to the Track page (W-Track). The rank is already saved either way.
5. Revised: only Lyrics has an N/A checkbox (instrumentals have none). When ticked, the slider becomes a hatched bar and the value reads "N/A". The other six rows have no N/A control; to leave one out, don't touch it.
6. Revised note: after a successful Save or Skip the user lands on the item page (Album page or Track page), which now shows the new rank. Leaving mid-compare loses progress, but once this screen is reached the rank is already saved either way.
7. Revised note: this screen is unchanged. The profile setting "Show factor bars on my pages" is changed on Edit profile (W-Edit). It only hides the bars on item pages; the sliders and the values saved with each rank event are unaffected. Whether this screen should still appear when the setting is off is open (see the change list).

Phones, left to right: nothing set; album with Lyrics N/A and Replay value and Cultural impact untouched; track with Lyrics set and Cultural impact untouched; the album state at 360px.

PROFILE · /ME · SIGNED IN · REVISED: UPLOADED AVATAR

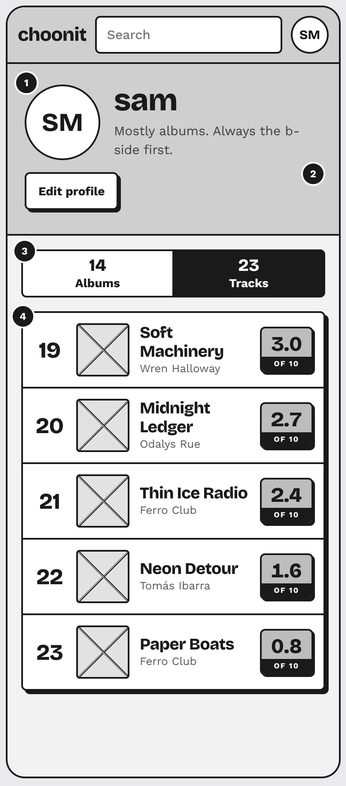

WIREFRAME · ALBUMS RANKED, INITIALS AVATAR

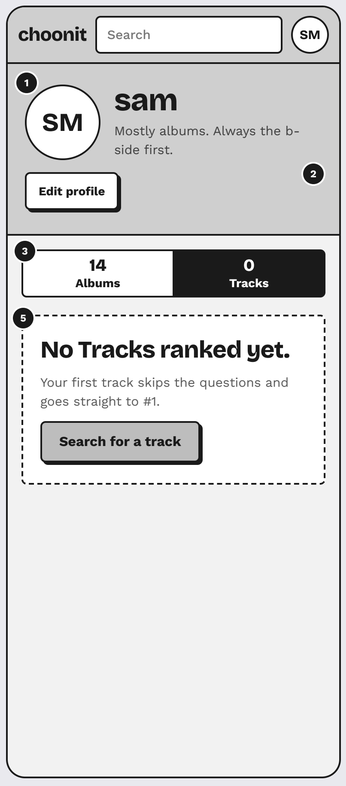

WIREFRAME · TRACKS RANKED, UPLOADED AVATAR (NEW)

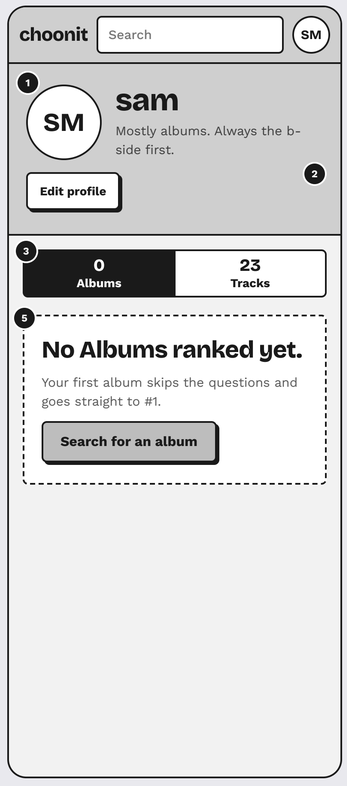

WIREFRAME · TRACKS, END OF THE LIST (NEW)

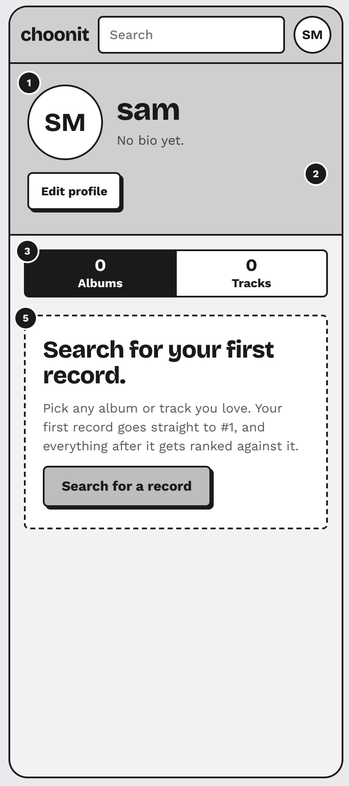

WIREFRAME · TRACKS EMPTY

WIREFRAME · ALBUMS EMPTY

WIREFRAME · BRAND-NEW USER

NOTES · REVISED

1. Revised: identity block on the blue hero: avatar, username, short bio. The avatar is now either the initials circle (no upload, or the upload was removed) or the uploaded image, cropped to a circle with the same keyline. Google profile pictures are never used. The image has a text alternative ("Your avatar").
2. Edit profile goes to the edit page and back. Unchanged.
3. Two tabs, Albums and Tracks, doubling as counters. One ranked list per tab, never mixed. The selected tab is dark-filled and also marked selected for screen readers.
4. Each row: rank, cover, title and artist, score sticker ("of 10" on the strip). Track rows use exactly the same layout. Titles clamp to 2 lines and wrap, so long track names don't break the row at 360px. Album rows link to the Album page, track rows to the Track page.
5. Empty states, unchanged: one list empty while the other has records (Tracks empty, Albums empty): says what happens next and links to search. Brand-new user (last column): "Search for your first record".
6. Shows five, then "Show all". Long lists load in pages.

Scores are illustrative sample data and descend down each list. The ranked list is flat, with continuous rank numbers (1, 2, 3…) and no grouping or labels beyond rank, title, artist and score. The last phone shows the end of the Tracks list. Sample data: 14 Albums, 23 Tracks.

COLOR · ALBUMS EMPTY

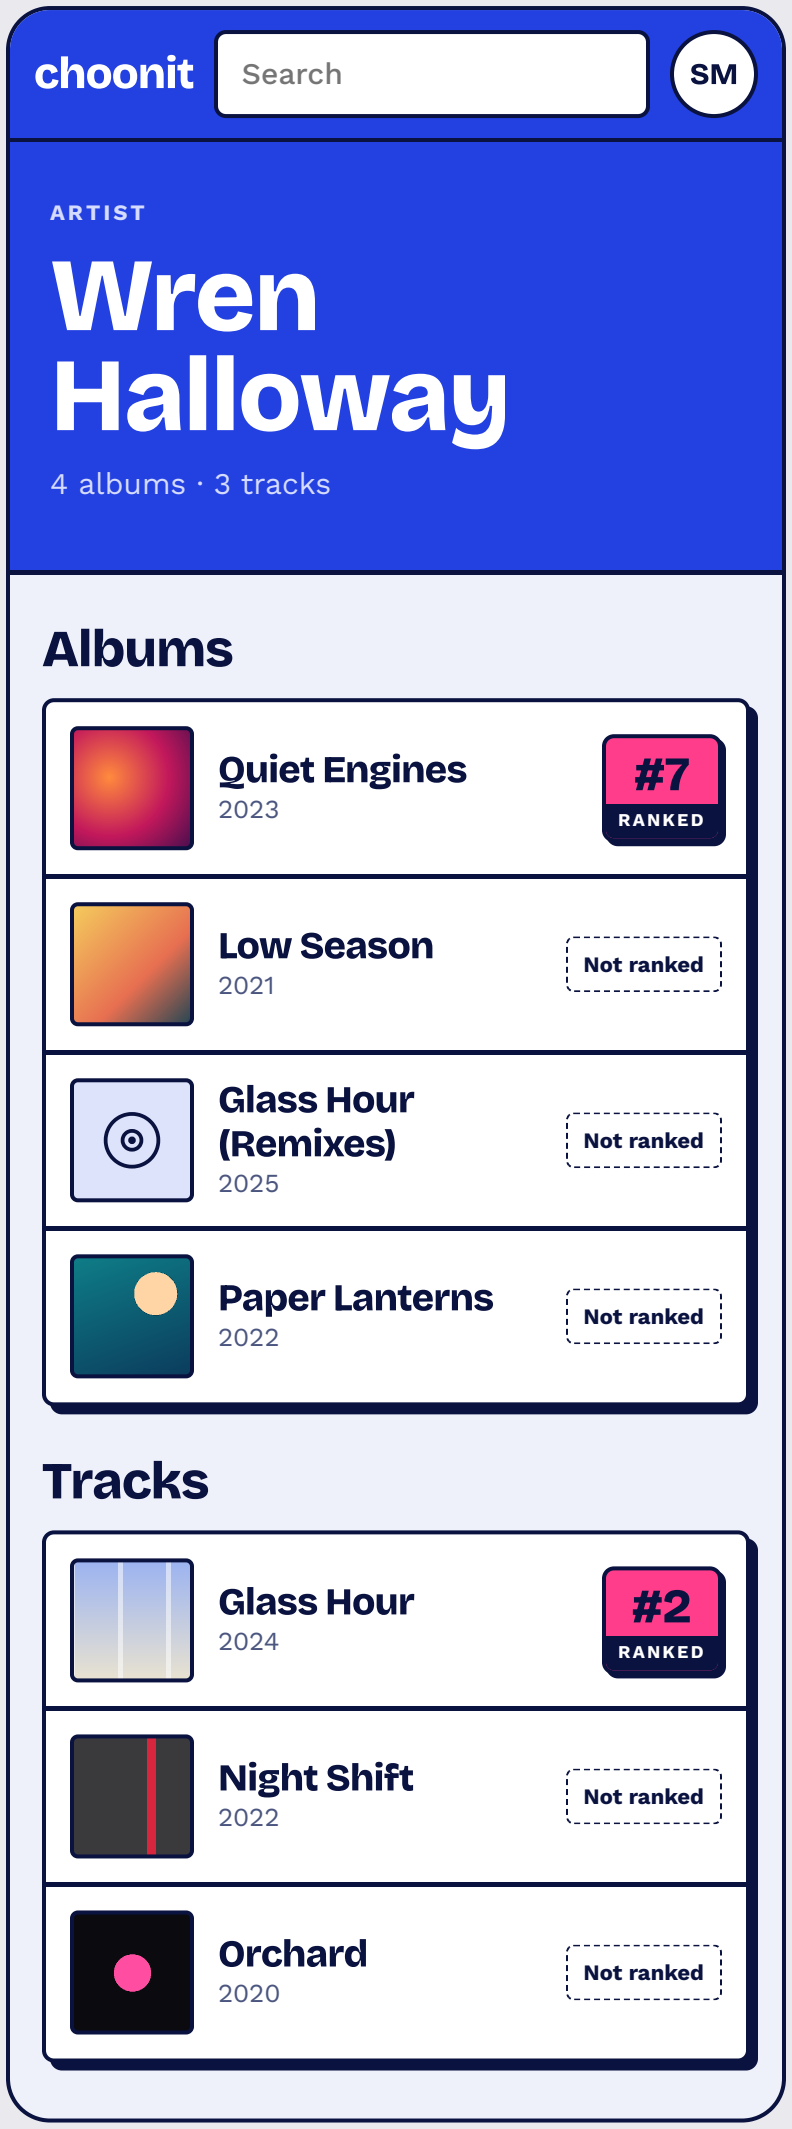

COLOR · BRAND-NEW USER

ARTIST PAGE · /ARTIST/:MBID · SIGNED IN · REVISED: ALBUMS AND TRACKS SECTIONS

WIREFRAME · GRAYSCALE

COLOR · CRATE DIGGER

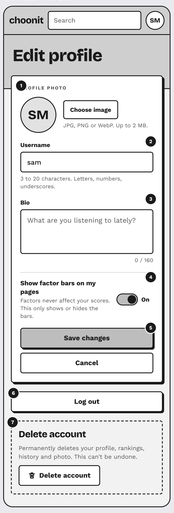

NOTES

1. Minimal on purpose: name and a count line, now "4 albums · 3 tracks". MusicBrainz has no artist photo, so the page leans on the covers below.
2. Changed: the discography is split into Albums and Tracks, replacing the LPs / EPs / Singles sections. Newest first inside each. Matches the two lists on Profile.
3. Each row shows your status: rank sticker, or "Not ranked". Tap to open the Album page.
4. EPs now live under Albums (an EP is an album for ranking). Same no-cover tile as everywhere else.
5. Tracks section: recordings by this artist, including singles. Rows open the Track page. Both sections need an empty line ("No tracks found") if MusicBrainz returns none.

EDIT PROFILE - /ME/EDIT - SIGNED IN - REVISED: AVATAR UPLOAD, BIO COUNTER, FACTOR BARS SWITCH, LOG OUT, DELETE ACCOUNT

WIREFRAME - DEFAULT

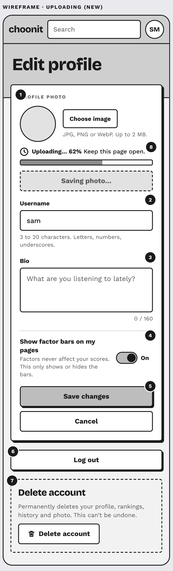

WIREFRAME - UPLOADED AVATAR, SWITCH OFF

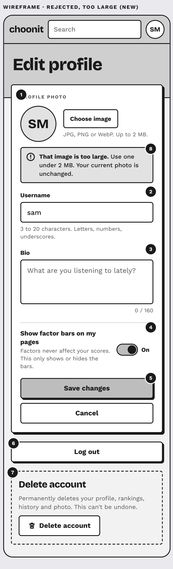

WIREFRAME - FILE CHOSEN, PREVIEW (NEW)

WIREFRAME - UPLOADING (NEW)

WIREFRAME - REJECTED, TOO LARGE (NEW)

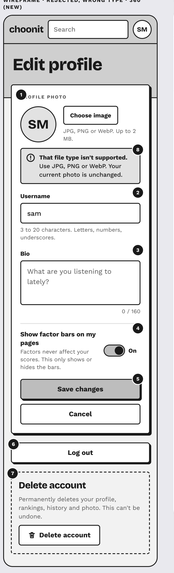

NOTES - REVISED

1. Revised: Profile photo section. Shows the current avatar (initials, or the uploaded image), a "Choose image" button (44px) and the rules in text: JPG, PNG or WebP, up to 2 MB. With no photo, the initials circle. Google profile pictures are never used.
2. Username stays editable; check for duplicates and show the error inline, same icon-plus-text pattern as sign up.
3. Revised: bio with a visible counter ("42 / 160"), tied to the field with aria-describedby. The 160 limit is a proposal.
4. New: "Show factor bars on my pages", a real switch (role="switch", aria-checked) with a visible label, helper text saying factors never affect scores, and "On" / "Off" written out beside it, so state is never the knob position or color alone. Off hides the factor bars on Album and Track pages; the saved values are kept. Drawn On (most phones) and Off (second phone).
5. "Save changes" returns to Profile. Cancel returns without saving. They apply to username, bio and the switch; the photo has its own Save (pin 8).
6. New: "Log out" button, full width, 48px. It goes to the Landing page.
7. New: Delete account, a separate danger section at the very bottom (dashed box, its own h2, destructive-styled button with icon and text). It only opens the confirmation (pin 9).
8. New avatar states: file chosen (preview, file name and size, "Save photo"); uploading ("Uploading… 62%" as text, announced politely, with a bar that is never the only cue; the button is disabled); rejected (role="alert", icon and text, and "Your current photo is unchanged"). Rejections: too large ("That image is too large. Use one under 2 MB."), wrong type ("That file type isn't supported. Use JPG, PNG or WebP."), unreadable ("We couldn't read that image. Try another file."). The 360px phone shows wrong type. The server re-checks the file (type, size, re-encode), so the client messages are a courtesy.
9. New: delete confirmation, a modal sheet drawn as a viewport crop over the dimmed page. It lists what is deleted (profile, rankings and history, photo) and asks the user to type their username. "Delete my account" stays disabled (dashed, aria-disabled) until the typed text matches exactly, then becomes the destructive button, then reads "Deleting…" with the status line. Cancel is always available except while deleting. Focus: opens on the username field, Tab and Shift+Tab stay inside, Esc or Cancel close it and return focus to "Delete account"; after deletion the user lands on the Landing page.

States left to right, top row of each theme: default (initials, switch On), uploaded avatar with bio and switch Off, file chosen, uploading, rejected (too large). Second row: rejected at 360 (wrong type), default at 360, delete confirm disabled, delete confirm enabled, deleting.

ERROR PAGES · NOT FOUND, SOMETHING WENT WRONG, MUSIC DATA UNAVAILABLE · NEW

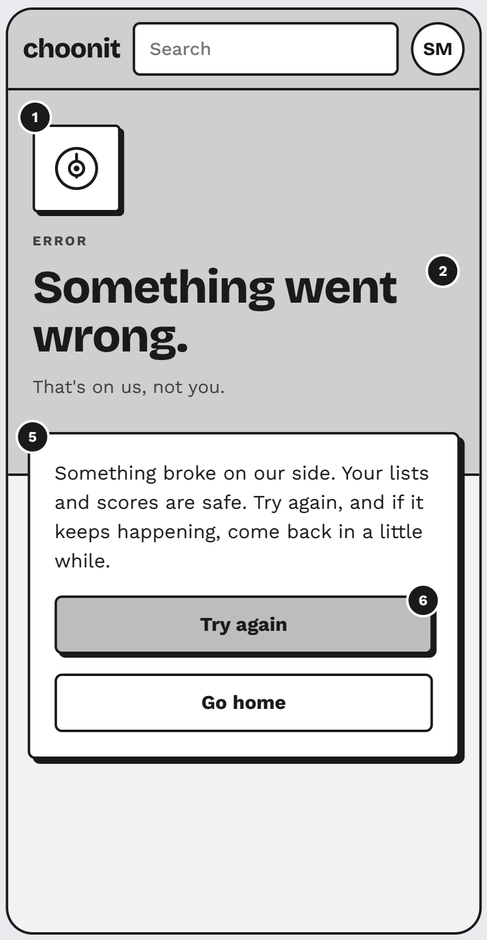

WIREFRAME · PAGE NOT FOUND

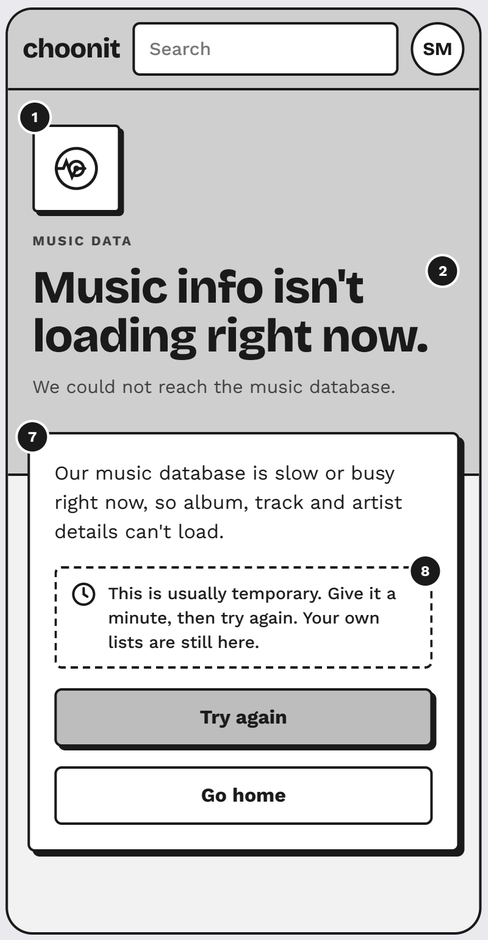

WIREFRAME · PAGE NOT FOUND · 360

WIREFRAME · SOMETHING WENT WRONG

WIREFRAME · MUSIC DATA UNAVAILABLE

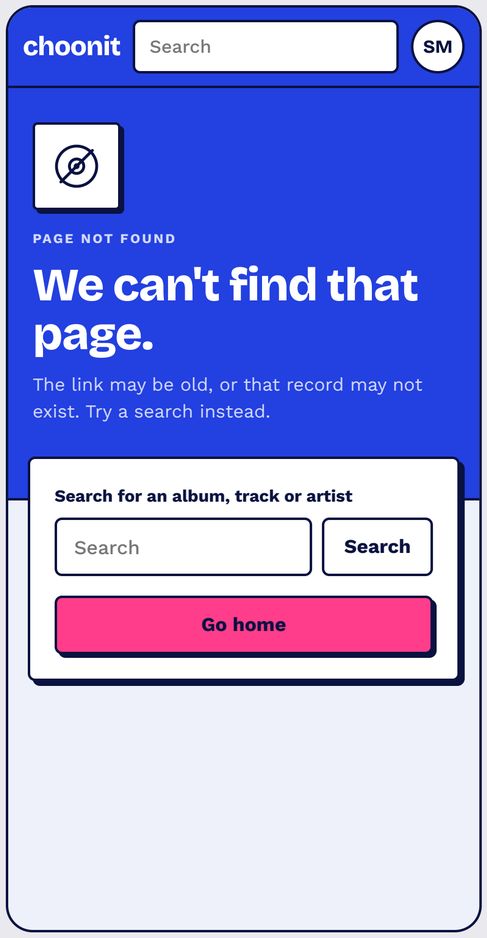

NOTES · NEW

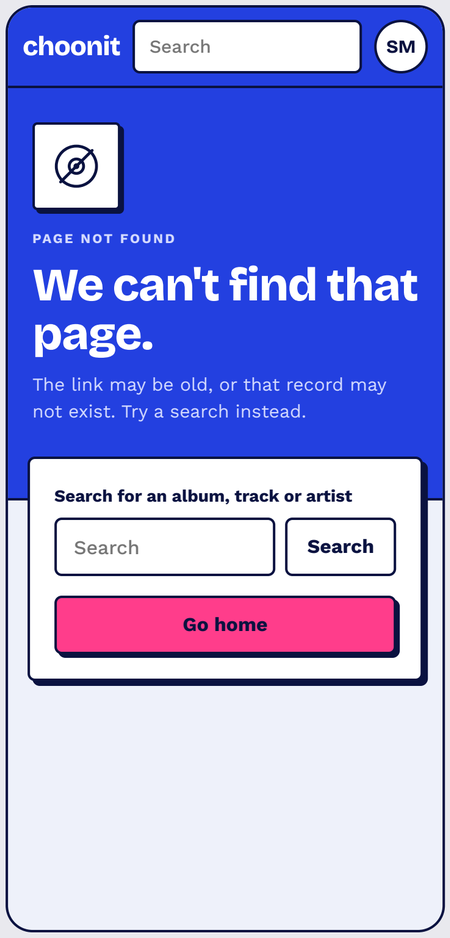

1. Same blue hero and record glyph on all three, with a small variation per case. The main message never shows a status code or technical term. The normal signed-in header stays, so the user can search or leave from anywhere.
2. One h1 per screen, in plain words. The eyebrow gives a short label ("Page not found", "Error", "Music data").
3. Page not found. Reached by a URL that matches no route, or an MBID that MusicBrainz says does not exist. It has a search box with a visible label (and the header search) as the way to recover.
4. "Go home" is the single primary action and goes to the Profile (the signed-in home); for a signed-out visitor it would go to the Landing page. The Search button is secondary.
5. Something went wrong. Not reachable by a link: shown when the app hits an unexpected failure (a server error or a crash on the page). The message is announced (role="alert").
6. "Try again" is the single primary action: it repeats the failed request. "Go home" is the secondary button.
7. Music data unavailable. Not reachable by a link: shown when a request to MusicBrainz or the Cover Art Archive times out, returns a server error, or is rate-limited. It replaces the content area of the page (search results, album, track or artist), so on a real page the header and the user's own data stay.
8. A dashed note says it is usually temporary. Text plus a clock icon, never color alone. "Try again" is the single primary action.

The 360px phone is the not-found page, where the search field and its button share a row. Buttons are 48px tall and full width.

NOTES · NEW

1. The header is real, not a skeleton: logo, search box and profile link work while the page loads. Each skeleton is one screen at 390px; the Profile skeleton is repeated at 360px, the tightest row layout.
2. Blocks use the same sizes, padding, borders and shadows as the final layout: the 290px cover with its hard shadow, the 68px / 62px / 56px row covers, filter chips, the avatar circle. On the blue hero the blocks are a translucent tint of the hero color. Real labels that never change (the Albums and Tracks tab names) are shown as text; only the data is blocks.
3. Sticker and button blocks keep the exact footprint of the rank sticker (132 by 92px on item pages, 58px on rows) and the 48px action button, so the layout doesn't shift when the data arrives.
4. Rows use the same counts and heights as a typical first page of the real list (five profile rows, six tracks, three "appears on" rows). No spinner anywhere as the main pattern.
5. Accessibility: each skeleton region has aria-busy="true" and aria-live="polite", with a visually hidden "Loading search results" style label (role="status") so screen readers hear one message, not a pile of empty blocks. When data lands, aria-busy is removed. The blocks are empty decorative elements with no text, so there is nothing for a screen reader to read.
6. Motion: the shimmer is a slow left-to-right sweep. Under prefers-reduced-motion: reduce the animation is off and the blocks sit at a flat tint (see the media query in the board CSS).
7. Known trade-off: Album and Track skeletons mirror the ranked layout (rank panel, history, then bars or track list). A page for an unranked record is shorter, so the lower blocks would collapse when data arrives. If that is not acceptable, fetch the user's rank with the page shell so the skeleton can match either state.
8. Revised, no new screens. Edit profile has no skeleton: the README lists skeletons only for pages that fetch music data (search results, Album, Artist, Track, Profile), and Edit profile is a short form over your own row, so it follows the other form screens (Sign up, Forgot, Reset) and shows no skeleton. The Profile skeleton keeps its single block of rows; the Profile list is flat, with no section headers, so the skeleton matches it.

Phones, left to right: Search, Album page, Track page, Artist page, Profile (Albums tab), Profile at 360px.
